About Njini

Njini [N-gene-E]

Njini is a stylized version of the word ingenious. Ingenious is Njini's ethos, and we strive to ensure that whether it is our technology, solutions, or the way in which we interact with our customers - everything that we do is Njinious!

The nature of data storage management is rapidly changing. The traditional business of storing, securing, retrieving and analyzing a corporation's data was a well understood and stable exercise that revolved around the management of mainframe data, or in the distributed world, database data. In today's business environment, demand for data storage has been growing at an exponential rate, with the biggest growth area being Unstructured Data. According to IDC over 95 per cent of the digital universe is Unstructured Data and according to Gartner, 85 per cent of all new business information created within organizations is Unstructured Data.

(Network file management and control services are a key component of the File Area Network (FAN) reference model that was recently adopted by SNIA, the Storage Networking Industry Association.)

The Solution

Njini is the first company to deliver an integrated storage solution that automatically generates indexes for data files, and uses that index to drive real time business policy. Njini's Network File Control (NFC) solution provides your organization with the ability to take total control of Unstructured Data across your data storage environment. This is achieved by providing a single point of "command and control" for Unstructured Data. -- enabling the delivery of a common set of network resident file services, centrally defined and managed via policy, and then applied across a heterogeneous storage environment, without change to either the user's desktop hardware, data center hardware, or to established procedures for backup, data security, disaster recovery and high availability.

At one touch, an organization implementing Njini's technology can radically change the economics of its storage management by: optimizing the degree of space required to store data; taking advantage of cheap near-line storage solutions without disrupting end user work flows; enforce regulatory compliance as a matter of course in the infrastructure; and, offer a corporation a way to effectively categorize and search their data.

Proven return on investment (ROI) with complete investment protection, providing up to 30% savings over your typical storage costs. Njini delivers these savings through our de-duplication technology, our intelligent ILM capabilities, and our unique active archiving process.

Njini is the only software provider to offer businesses this level of granular control over Unstructured Data. We work with our customers to scale our NFC software to their specific needs and by doing so can provide demonstrable ROI in under one year. Our track record combined with the expertise of our team means we are not just an average software vendor, but are able to provide industry knowledge and support services. By giving our customers total control of their unstructured information assets, we allow them to effectively manage, secure and optimize their data centers.
